KENNEDY Tool PROFESSIONAL Control

CAD designed and high precision laser cut foam tray inserts are designed to keep tools precisely and accurately in the correct position and drawers for improved productivity. In some applications a dropped tool is a serious hazard, colour contrasting foam inserts are used to easily recognise lost tooling and also reduce audit time.

Areas of use include food industry maintenance, automotive assembly.

Using Your Plane

- Always hold the plane firmly to ensure optimum balance and control. Ensure the workpiece is secure and stand behind the plane - never pull a plane towards your body.
- When planing end-grain, plywood, blockboard or difficult/curlly grain, the direction of the cut is extremely important. A 'slice' action is advised or splitting may occur. This is achieved this by holding the plane at an angle as shown.
- Splitting can generally be prevented in several ways:
 - 1) By planing towards the center of the workpiece
 - 2) Bevel the corner of the workpiece before planing
 - 3) Clamp scrap wood level with the edge of the surface being planed and plane it straight across.

Maintaining Your Plane

- A plane is a precision tool, therefore it should always be treated with care. Always store the plane on its side — this will avoid unnecessary damage to the blade.
- Always sharpen the blade before use. This will make it easier, and safer to use and produce a superior surface finish.
- Before sharpening the blade take the blade out of the plane and remove the cap iron. Always lay the blade flat on a firm surface before taking out the screw.
- Sharpen your blade using an oilstone. Best results are achieved by using a honing guide - this will give the ideal angle at the cutting edge of the blade.
- Use machine oil to keep the surface of the stone wet but remove excess before use. This is to prevent dust and metal particals from clogging the stone.
- Remove any burrs by laying the front of the blade flat on the oilstone and work it in a "figure-eight" motion.
- Painted surfaces should be sanded or stripped back before planing in order to avoid clogging of the blade and damage to the timber.
- Never plane over nails, this will damage the blade.
- Always wipe the blade with a cloth before replacing it.
- Candle wax applied to the sole of the plane may reduce friction, especially on freshly cut timber.
